

Positive Primer Set 8

Catalogue no: 800007

Chromatrap®'s Positive Primer Set 8 provides the necessary tools required for successful qPCR to validate your CHIP assay. It is a complete primer set including both forward and reverse primers, with sufficient primer mix supplied for a whole 96 well plate. Chromatrap®'s Positive Primer Set 8 is not suitable for use with non-human species.

Background:

Chromatrap®'s Positive Primer Set 8 amplifies a 78 base pair fragment of the Interleukin-8 gene, found on human chromosome 4. IL-8 is a pro-inflammatory chemokine, whose increased expression correlates with the progression of cancer.

It is a positive gene target for the nuclear transcription factor NF-kB.

Suggested Usage:

Primer Set	Suggested Dilution	Figure
Positive Primer Set 8	Dilute from 4µM (provided) to 1µM working concentration	1

Please note: Optimal dilutions should be determined by the user. These volumes are stated as guidelines only.

Figure 1. Melt Curve of Positive Primer Set 8

Positive Primer Set 8 was run at a working concentration of 1µM. The melt curve confirms that only one PCR product is amplified with this primer set during qPCR.

Advancements in Epigenetics

*This product is for research use only. There is a possibility that results may vary between antibody lots.
